

Burlington Automation

Case study: Metal Fabrication

Application

- Plasma cutting

Products

- Steel beams

Breaking the robot barrier

Robots have long been considered an impossibility for the custom-driven construction steel industry. But in Canada, thanks to Burlington Automation, Azimuth Three Enterprises has now broken the robot barrier - in the process boosting productivity and creating the efficiency edge that will keep it ahead of the pack.

> Azimuth Three Enterprises (AZ3), located in Brampton, Ontario, recently turned to an approach that is still so novel that executives in fabrication shops elsewhere don't even believe it exists: custom-fabrication robotics. Working with robotics integrator Burlington Automation of Burlington, Ontario, AZ3 has invested in a robot equipped with a plasma torch and linked to software to undertake the tasks of cutting holes in beams and cutting the beams themselves. The result has been a burst of productivity, a way to address the labor shortage and a simplification of AZ3's production process.

At its heart, steel fabrication is the value-added treatment of beams delivered from a steel mill before they're delivered to construction sites. Depending on specifications supplied by architects, beams may have holes cut for bolts and other fasteners, slotted to accommodate

stiffeners and trimmed to make copes or miters. Then they may be cleaned and painted. Highly skilled fitters may add clips on the ends and perform other tasks, depending on the job. Each job is custom, and usually the work varies from beam to beam even within the same order. That presents a formidable obstacle to robots, which usually perform repetitive tasks.

Paul Kwiatkowski, Burlington's sales manager and part owner, says his company has systems to overcome that obstacle. Burlington adapted standard robots supplied by ABB Robotics to the complex and constantly changing tasks of steel fabrication, including allowing them to cope with minor flaws in the steel, which can vary in dimension. (Even standard beams may be a 1.6 mm or more out of specified dimension.)

People have been sceptical about automating the industry with robots, Kwiatkowski says. It certainly

- hasn't been easy. Burlington has been working on robotics integration since 1995, with varying degrees of success. "The problem," he says, "was that programming was very difficult." The task got a little easier in 2000 when Burlington began porting technical data from 3D design program software, manipulating it and feeding it directly to the robot. Suddenly, the complex instructions that had to be programmed for each piece of steel could flow through from the design software. "Now," Kwiatkowski says, "you don't have to manually program."

ABB Robotics supplies Burlington Automation with the kinetic soul of its product, a special order IRB 2400L 6-axis robot. This device is no stranger to the world's workshops: 14,000 have been deployed, and refinements are being made all the time, including innovations in software. Burlington works with ABB Canada constantly on refinements, such as improving data-connection times between the controlling computer and the robot. ABB Canada can provide integrators with welding and thermal cutting strategies tailored to their specifications. Options include off-the-shelf software as well as a suite of software known as ArcWare for more complex needs. In addition, ABB provides sophisticated software packages that enable integrators like Burlington to write their programming.

> FACTS

Benefits

- Simplifies shop layout, increases speed and accuracy and addresses a growing shortage of skilled workers.
- Is capable of doing the work of conventional drill, beam, flanger, angle and bar lines, coping machines, band saws, marking machines and small burning tables.
- Reduces both cost – capital and maintenance – and time. Burlington also provides ongoing support and regular software upgrades.
- Bolt holes made by the system conform to provisions laid out in the RCSC Specification for Structural Joints Using ASTM A325 or A490 Bolts.
- Results in a cleaner shop that is more agreeable to work in due to fume- and dust-extraction equipment.

Paul Kwiatkowski, sales manager, Burlington Automation, says his robotics system can boost shop productivity by a factor of six.

A modular concept enables integrators to work with a variety of robots, power supplies, data networks, positioners and other third-party devices. And even more specifically, ABB Canada teams with Burlington on solving customer-specific technical issues. Says Tamara Mulcahy, general manager and vice president of operations for ABB Canada's robotics division: "If you're a system integrator, ABB is your ideal business partner. We'll support you with the tools you need to advance your customers' business."

Acceptance of robotics by the steel fabrication industry hasn't been easy, Kwiatkowski says. Companies want to see the robot systems up and running before they commit. "In this industry, everybody wants to touch and feel," he says. "It's like buying a car." But Burlington's case is compelling. Kwiatkowski says his robotics system can boost shop productivity by a factor of six. There is no need for a burning table, for drilling machines or many hand tools. The robot is suspended in an enclosure and can hover around various sizes and kinds of steel beams. At AZ3, the robot bustles above a 4,500 kilogram, 18 meter beam like an industrious bee, accurately zapping holes and slots and cutting copes in mere seconds. By contrast, hand cutting can take 10 minutes or more when you factor in the measuring.

Many shops still use pencil and paper to interpret from blueprints where holes have to be cut. That process is slow and prone to misinterpretation of designers' specs. And then there's the shortage of workers, a situation that is getting worse, says Jean G. Diab, vice president of operations in the International Markets and Structure Division of AZ3. ○
