

Power Transformers

Efficient solutions

In the year 2000 the TrafoStar power transformer was launched by ABB.

The TrafoStar is the ABB power transformer concept implemented in all ABB factories worldwide. The TrafoStar means common design criteria, global processes and quality supervised by 6-Sigma system.

Generator step up transformers, substation transformer and railway feeding transformers with voltages up to 800 kV are built all to the TrafoStar concept. Additionally ABB supplies shelltype power transformers for special applications. In other words TrafoStar power transformers meet all possible needs of our customers for example: utilities, transportation companies, independent power producer contractors and industry.
